## Limits \& Continuity <br> 1.2 - Limits by Substitution

Some limits can be found by direct substitution, while others cannot. The "Rules for Limits" exist to help in determining which limits can be found by substitution.

## Rules for Limits

For any constants $a$ and $c$, and any positive integer n : 1. $\lim _{x \rightarrow c} a=a$
2. $\lim _{x \rightarrow c} x^{n}=c^{n}$
3. $\lim _{x \rightarrow c} \sqrt[n]{x}=\sqrt[n]{c}(c>0$ if $n$ is even $)$
4. If $\lim _{x \rightarrow c} f(x)$ and $\lim _{x \rightarrow c} g(x)$ both exist, then
a. $\lim _{x \rightarrow c}[f(x)+g(x)]=\lim _{x \rightarrow c} f(x)+\lim _{x \rightarrow c} g(x)$
b. $\lim _{x \rightarrow c}[f(x)-g(x)]=\lim _{x \rightarrow c} f(x)-\lim _{x \rightarrow c} g(x)$
c. $\lim _{x \rightarrow c}[f(x) \cdot g(x)]=\lim _{x \rightarrow c} f(x) \cdot \lim _{x \rightarrow c} g(x)$
d. $\lim _{x \rightarrow c} \frac{f(x)}{g(x)}=\frac{\lim _{x \rightarrow c} f(x)}{\lim _{x \rightarrow c} g(x)} \quad$ if $\lim _{x \rightarrow c} g(x) \neq 0$

## Summary of Rules of Limits

For functions composed of additions, subtractions, multiplications, divisions, powers, and roots, limits may be evaluated by direct substitution, provided that the resulting expression is defined.

$$
\lim _{x \rightarrow c} f(x)=f(c)
$$

Ex A: Finding Limits by Direct Substitution \#1) Find $\lim _{x \rightarrow 4} \sqrt{x}$.
\#2) Find $\lim _{x \rightarrow 6} \frac{x^{2}}{x+3}$.
\#3) Find $\lim _{x \rightarrow 3}\left(2 x^{2}-4 x+1\right)$.

## Limits \& Continuity

## 1.2 - Limits by Substitution

Sometimes direct substitution into a quotient gives an undefined expression. If this happens, factoring, simplifying, and then using direct substitution may help.

Ex B: Finding Limits by Simplifying
\#1) Find $\lim _{x \rightarrow 1} \frac{x^{2}-1}{x-1}$ and graph the function.

\#2) Find $\lim _{x \rightarrow 5} \frac{2 x^{2}-10 x}{x-5}$ and graph the function.
